Highlighted Myocarditis Reports

All ages under 20

VAERS_ID: 1081208

AGE: 18

This is a 18 y.o. male who is generally healthy. He received a second dose of the SARS2-COV vaccine on 3/4. The following morning he felt feverish and achy with malaise. He stayed home, drank fluids and rested and felt well enough to come up to ski this weekend. During skiing he had some anterior chest pain, it resolved and he went about his day. Tonight at 2245 the pain became sharp and awakened him from sleep. He felt nauseated and clammy as well. Father brought him to the ER for evaluation. His emergency department evaluation showed ST elevations most notably in the inferior and lateral leads as well as in the lateral precordium.

VAERS_ID: 1141993

At 2-8-21 at approximately 1:00pm I received my 2nd shot. At 5:00am on 2-9-21, I woke up experiencing an extreme headache, nausea, body aches, and severe chest pain. I checked my heart rate with a PulseOximeter and found it to be elevated at 105-115. I called out of work and rested in bed for the day. On 2-10-21 most of my symptoms had subsided however the chest pain persisted through 2-11-21. On 2-11-21 at 2:00pm, I visited the Urgent Care. While there, the provider ran an ECG, Chest X-Ray, and bloodwork. Test results showed Troponin levels in my blood had reached critical levels of 7.72ng/ml. I was immediately transported to the ER at the Hospital, where on arrival they did an EKG and bloodwork. I was then admitted and seen by a cardiologist, who ordered a CT Angiogram, more bloodwork, and an Echocardiogram. After I was admitted, my mother contacted the nurses station to check on me and asked what was wrong. Received Jansen COVID injection at approximately 11am 4/3/2021. She was then told the hospital was treating me for an NSTEMI and Myocarditis. This resulted in a 3 day hospital stay where the results of the tests showed there was nothing wrong with my heart other than the well-awake most of that night. Felt slightly better morning of 4/6/2021, but increased Troponin levels. It should be noted that I have had ZERO previous cardiac issues, or any other significant health issues. I was discharged from the hospital with lower but still elevated Troponin levels, pain, and his arms felt like they were on fire. Was taken to ER at Clinic and told to follow up with my primary care doctor. I had no health issues Blood pressure 149/98, temp 100.6, complain of feeling feverish and short of breath. EKG was taken which was abnormal and enzymes noted to be elevated. Transferred to main branch of Clinic approximately 4:30am 4/5/2021. Father states patient has inflammation around the heart. Had a cardiac catheterization today 4/6/2021-father states that was normal and

AGE: 17

Fever developed about 10 hours after the injection. Average temp throughout the night and first part of the next day was 104.7 also (4/15/21), On 4/17/21 (ie within 48 hours of receiving COVID-19 Pfizer shot #2 (4/15/21), my daughter began experiencing chest pain in the PM (PM of 4/17). It was experienced severe headache, chills, and muscle aches and pains. Throughout the day after the injection (4-10-2021) these symptoms initially improved but did not completely resolve. Overnight from the 10th into the morning of the 11th my daughter had shortness of breath. The next morning of the 11th we went to Urgent Care. Upon presentation at urgent care, she had an irregular EKG, we were advised to immediately do a Hospital ER, upon arrival she presented with same EKG findings from urgent care, BW was run and her Troponin level was a 7, this Hospital recommended (after consultation with their cardiologist) that based on abnormal Troponin. I was admitted with a diagnosis of myocarditis.
