CCP-19 Virus Mortality • United States

Technical Note

- All figures are cumulative (trends are good for panic & micro-management).
- The way infections are determined; the number of tests; the types of tests & testing, are different for each state. The CDC provides figures for “confirmed” & “probable”. Thus the number of cases is the only reliable figure, it is used as the base.
- Number of cases; etc, are great for causing panic, especially when more relevant figures are not provided. What is relevant is the **Cases per capita**, for each state (not just number of cases), expressed as a percentage here. It indicates how badly the infection is spreading, or the success of prevention measures.
- Likewise, reporting deaths *alone* is great for causing panic. The slightly more relevant figure is **Deaths per Capita**, sometimes reported as *mortality*. It is a weak indicator of how deadly the virus is, overall.
 - It is well known that the virus is lethal to the aged, and especially those who have prior medical conditions. That is not presented here.
- The **Death per Case** or *actual mortality*, which is the percentage of deaths per cases, is even more relevant. It indicates the success/failure of treating infected people, thus it is a better indicator of mortality.
 - Again, overall, without a breakdown by age.
- For comparing the states with each other:
 - Train your eye to pick out the (eg) yellow only: check your favourite states
 - Ditto the pink

Analytical Note

- The United States is a federation of states, each of which have their own legislature; laws; etc. The federal level can only give guidance.
- Blaming the federal level for whatever happens in each state, or in the states overall, is plain stupid. But that what the oligarchy and their media promote, and that is what the media slaves follow. *Orange an Bad, and he is to blame for everything, especially the things he has no control over.*
- That is why there is such a great disparity re the figures at the state level, as the chart plainly shows.
- Eg. Governor Cuomo, not President Trump, is responsible for the massive deaths (actual mortality) in NY State & NY City. He famously sent all aged people to care homes to get infected and die together, it is nothing short of mass murder.
- The total for the United States (last figure) is therefore meaningless, necessary only for use in comparison with other countries.
- The way each state counts a Case or Death is different: infected; possibly infected; household of infected; etc, death by virus; death where virus played a role; etc.
- Eg. North Dakota has the most conservative Case determination, and thus it has the highest Case rate. It also has the best treatment facilities, and thus the very low mortality.
